PROFESSIONAL PROFILE

Operations and planning transformation leader who understands both the decisions leaders need to make and the work teams must do to deliver them. Across Valeo Foods, Coca-Cola and WaterWipes, I have turned fragmented information, manual work and short-term operating routines into clearer processes, usable systems and better decision support.

I bring an entrepreneurial, end-to-end approach: assess process, ownership, data and tooling together; use available technology to build maintainable solutions; and learn the skills each delivery needs. My strongest contribution is turning operational understanding into practical systems, automation and applied AI, from diagnosis and requirements through implementation, adoption and improvement.

CORE CAPABILITIES

- **Operational diagnosis and opportunity assessment:** Map the real workflow, handoffs, exceptions and decision needs; evaluate where changes can improve capacity, control, service and user effort.
- **Solution design and implementation:** Translate business needs into processes, information structures and practical tools; carry work through testing, UAT, training and operational handover.
- **Automation and applied AI:** Connect collaboration, analytics and structured records using Microsoft 365; encode domain expertise into Copilot prompts and repeatable knowledge workflows.
- **Business understanding and communication:** Work with commercial, finance, supply and executive stakeholders to clarify assumptions, explain trade-offs and turn insight into decisions and accountable actions.
- **Technical prototyping and workflow delivery:** API/webhook prototypes with Zapier and Make.com; Power Automate data flows, Google Sheets scripting and Excel VBA.

PROFESSIONAL EXPERIENCE

Head of Demand Planning & S&OP Transformation | Valeo Foods Ireland

February 2026–Present

- Developed the S&OP framework by first improving process sequence and ownership, assessing maturity/readiness across people, process, data and technology; then designed the tools needed to manage the framework at company scale.
- Built an S&OP Control Tower using Teams, SharePoint Sites and Lists, document libraries, Power BI, Excel and Power Automate. Connected analytics with structured assumptions, decisions and escalations; organised meetings and deliverables for ownership and traceability.
- Built automated decision-escalation flows comparing quantitative insights with qualitative planning assumptions; designed transcript-to-minutes-to-actions workflows and Copilot prompts, notebooks and agents for knowledge retrieval and communication.
- Improved the Lists data model to capture a missed opportunity for analysis at scale. Added explicit numerical fields and identifiers aligned to existing report keys, making qualitative assumptions queryable and connecting them with the reporting toolkit.

Global Demand Planning | The Coca-Cola Company

January 2024–February 2026

- Developed forecasting approaches and decision-support practices across approximately 50 international markets and 5,000+ SKUs, combining quantitative analysis with commercial context and local assumptions.
- Partnered with market leadership to improve forecast performance from approximately 44% to 80%; established a monthly Demand Review cadence and accountability for promotional and new-product assumptions.
- Built an automated narrative workflow: variance triggers identified relevant changes, initiated stakeholder tasks to collect explanations and populated core weekly presentations, reducing manual coordination and releasing time for analysis.
- Designed and delivered planning-process training for more than 20 global teams, translating methods into consistent everyday practices.

PROFESSIONAL EXPERIENCE CONTINUED

Senior Global Supply Planner | WaterWipes

January 2022–January 2024

- Acted as process lead for Supply Planning and Demand Planning during SAP S/4HANA and SAP IBP implementation, from discovery through hypercare. Mapped processes and master data, gathered business needs, supported testing/UAT and delivered training.
- Built a structured Excel planning environment and redesigned planning routines before the enterprise platform was available; extended visibility from approximately one week to a rolling one-year horizon.
- Improved import cadence and inventory decisions, reducing raw-material inventory by approximately 30%; consolidated the US 3PL footprint with approximately 20% lower safety-stock valuation.
- Connected production, inventory and logistics requirements with system design while maintaining day-to-day planning through the implementation.

Purchasing Manager | Aristospray

January 2020–January 2021

- Diagnosed a manual stocktake process and rebuilt its counting, validation and reconciliation workflow using Google Sheets and scripting. Introduced location logic, live comparisons and targeted recounts.
- Reduced stocktake from approximately three working days to three hours by redesigning the work and its controls, then automating the flow of information.
- Managed purchasing, inventory governance and supplier coordination; introduced segmentation and analytics to improve stock visibility and replenishment decisions.

Supply Planner & Buyer | Votorantim Cimentos, Brazil

January 2015–January 2019

- Coordinated planning and procurement across approximately 24 industrial plants and a €4.2m transactional budget, balancing operational requirements, suppliers and cost.
- Managed procurement and project coordination for greenfield factory CAPEX investments, working with project and operations stakeholders from early planning through delivery.
- Supported a large-scale asset-management data conversion involving approximately 250,000 data items, developing experience in complex operational data and system transitions.

INDEPENDENT METHOD AND APPLIED AI DEVELOPMENT

Develop and apply L.I.L.Y. (Lean Integration Lets You), my operational diagnostic method. It assesses maturity and readiness across people, processes, decision rights, assumptions, data and technology. Interventions progress through Remove → Simplify → Standardise → Digitise → Automate → AI. My approach prioritises fit-for-purpose solutions using available resources, keeping development in-house and supporting long-term maintainability.

Build API/webhook prototypes with Zapier and Make.com, alongside Power Automate workflows, Google Sheets scripts and Excel VBA. Develop prompt architectures across Copilot, Claude, ChatGPT and Gemini. Aluna's diagnostic connects a form, Google Sheets, scripts, email delivery and dynamic HTML reports. Colleagues continue to use tools and templates I have created.

TOOLS AND EDUCATION

Power Automate • SharePoint • Lists • Teams • Power BI • Excel and VBA • Google Sheets and Apps Script • Zapier and Make.com (API/webhook prototypes) • Copilot • Claude • ChatGPT • Gemini • SAP S/4HANA and SAP IBP business processes • Optimity

Bachelor's Degree in Business Administration and Management | Industry College IEL, Brazil | 2013–2017

Project Management | QQI, Ireland | 2021
